

NETSIGHT™ POLICY MANAGER AND USER PERSONALIZED NETWORK ASSESSMENT, DESIGN AND IMPLEMENTATION SERVICES

Benefits of the User Personalized Network

Enterasys Networks' User Personalized Network is a breakthrough solution that intuitively understands who the networks' users are, what their role is to the business and what resources they can or can't access. All while maintaining the highest level of security.

In addition to aligning IT with the business, the User Personalized Network aims to solve some high-level problems...

- **Lower IT costs.** Since the User Personalized Network's advanced authentication and profiling occurs automatically, downtime and daily reconfiguration issues are virtually eliminated. You also extend the life of your IT investment by being able to better conserve bandwidth usage on a per-user and per-department basis.
- **Greater security.** Because you have total control over which resources or databases users (as well as departments) can access, you can be sure that vital information and company resources are kept secure.
- **Increased productivity.** User Personalized Network means that users have immediate access to the resources they need to work more quickly and effectively, regardless of where they log on to the network—at corporate, at home or on the road in a co-worker's office.

Role-Based System Management for the Enterprise

An essential element of Enterasys' User Personalized Network (UPN), NetSight Policy Manager provides Role-Based Administration in the UPN, whereby a business or organization is modeled in software by turning technology abstractions into information meaningful to both business and technology personnel.

NetSight Policy Manager goes even further by providing graphical views of the entire enterprise, not just individual devices. So instead of viewing and configuring each switch, router or other network device individually to achieve a common goal for the network, the network is configured as a single system to reduce complexity.

Importantly, NetSight Policy Manager works within your existing infrastructure to protect network investments. Because NetSight Policy Manager works with your existing security system, for example, there's no need to purchase an additional authentication server. At the same time, NetSight Policy Manager fine-tunes the classification capabilities of Enterasys Matrix™ to make them easier to use.

NetSight Policy Manager and User Personalized Network Services: Flexible Service Offerings Deployed As You Need Them

Designed to meet your unique needs, NetSight Policy Manager and User Personalized Network Services provide flexibility, efficiency and cost savings, allowing you to select the type and level of services you need to meet your business goals.

With **Assessment Services**, an Enterasys network specialist will:

- **Identify the network components** required to deploy NetSight Policy Manager and the User Personalized Network, including user directory, authentication services and infrastructure information
- **Document current computing environment**, such as detailed end-user information, geographic considerations, key business processes, information architecture/flow, and more
- **Identify opportunities** where NetSight Policy Manager and the User Personalized Network features add significant customer value
- **Identify customer training needs**, especially for core on-site personnel responsible for long-term maintenance of the deployment
- **Complete summary** with recommendations based on the information gathered during the assessment

NetSight Policy Manager and User Personalized Network **Design and Implementation Services** can be customized for your organization. Highly trained and experienced networking specialists provide the level of services you require to ensure the security, productivity and quality of your implementation right from the start.

Design and Implementation Services can include:

- **Loading NetSight Policy Manager**
- **Configuration of the Radius server**
- **Configuration of the DHCP server**
- **Configuring end users**
- **Authentication**
- **Configuration of policies**
